The specification describes a parkin gene which has genetic alterations. Cells, or transgenic animals, that express the altered parkin gene are used to screen for compounds that can counter the effects of a genetic alteration in the parkin gene, or more generally for studying the properties of the parkin protein. Detection of the specified alterations is used to diagnose susceptibility to Parkinson's disease. The modified polynucleotide is also used to express the corresponding protein, which is then used to screen for potential anti-Parkinson agents and to raise antibodies (for detecting variants of parkin protein)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New variant forms of the human parkin gene, used as source of primers probes for detecting susceptibility to Parkinson's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WPI; 2000-411952/35.

                                                                               á
                                                                                                             밁
                                                                                                                                      Ś
                                                                                                                                                                                                                                                     The invention relates to Parkin protein and its corresponding nucleic CC acid sequence. The nucleic acid sequence is useful for altering the proteolytic processing of Parkin at its potential cleavage site at Asp CC proteolytic processing of Parkin at its potential cleavage site at Asp CC alzheimer's disease or ischaemic stroke. It also used for detecting the CC cocurrence of proteolytic processing of Parkin at Asp 126 in a sample, in CC monitoring a potential disposition for a neurodegenerative disease, and CC for treating, preventing and/or diagnosing Parkinson's disease or other cneurodegenerative disorders. The viral vector is used for treating compounds that increase or decrease CC apoptosis. It is also used in gene therapy. The present sequence is human CC Parkin protein encoding CDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
The invention relates to Parkin protein and its corresponding nucleic acid sequence. The nucleic acid sequence is useful for altering the proteolytic processing of Parkin at its potential cleavage site at Asp. 126. The invention is used in manufacturing or restriction and the corresponding nucleic sequences.
                                                                                                      New isolated nucleic acid sequence encoding a Parkin polypeptide, for treating, preventing or diagnosing neurological disorders, e.c. Parkinson's disease, Alzheimer's disease or ischemic stroke, and iscreening assays.
                                                                                                                                                                                                                                      Jensen

It also used for detecting the occurrence of proteolytic processing of Parkin at Asp 126 in a sample, in monitoring a potential disposition for a neurodegenerative disease, and for treating, preventing and/or diagnosing Parkinson's disease or other neurodegenerative disorders. The viral vector is used for transforming neuronal cells in vivo or ex vivo. The invention is useful for neurotransplantation into the CNS of a mammal. It may be used in screening assays to identify compounds that increase or decrease apoptosis. It is also used in gene therapy. The present sequence is human near the contract may be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Parkin D126 mutant

commodulating agent, by contacting an assay system comprising a purified HM polypeptide (human orthologue of genes that modify the p53 pathway in CC prosophila) or nucleic acid with a test agent under conditions, where but for the presence of the test agent, the system provides a reference CC activity, and detecting a test agent-blased activity of the assay system. CC also included are modulating (M2) a p53 pathway of a cell (comprising CC contacting a cell defective in p53 function with a candidate modulator that specifically binds to a HM polypeptide comprising an HM amino acid gequence, where p53 function is restored), modulating (M3) a p53 pathway of a cell defective in a mammalian cell (comprising contacting the cell with an agent that specifically binds an HM polypeptide or nucleic acid) and diagnosing (M4) a disease in a patient (comprising; (a) obtaining a biological sample expression; (c) comparison indicates a likelihood disease). (M1) is useful contentifying modulators of the p53 pathway. A probe for HM expression is useful for diagnosing breast, colon, kidney, lung and ovarian cancer, in a patient, where the cancer has greater than 25 % expression level. CC modulators identified by (M1) are useful in a variety of diagnostic and therapeutic applications, where disease or disorder prognosis is related to defects in the p53 pathway, such as, anglogenesis, apoptotic or cell cromparison of the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus restoring the p53 pathway of a cell, thus a anciocenic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ঠ
                                                                                                                                                                                                                                         밁

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                         The present sequence encodes a murine parkin2 polypeptide. The polynucleotide sequence contains a frameshift mutation, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, prion disease, Multi-system atrophy, Wilson's disease, pick's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotides encoding mouse parkin2 protein, useful for producing a transgenic non-human animal as an animal model for neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             P-PSDB;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleotide sequence of murine parkin2 with a frameshift mutation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              29-MAY-2001

                                         The present sequence encodes a murine parkin2 polypeptide. The polynucleotide sequence contains a frameshift mutation, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, alzheimer's disease, Huntington's disease, pick's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin protein

                                                                                                                                                                                                                                                                                                                                                                                                                                  to a stop codon, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25,2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease parkinson's disease, Alzheimer's edisease, Huntington's disease, Pick's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence encodes a murine parkin2 polypeptide. The polypucleotide sequence contains mutations, causing Arg78 to be changed to a stop codon, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Alzheimer's disease; Huntington's disease; amyotrophic lateral scleros Multi-system atrophy; Wilson's disease; Pick's disease; Prion disease; brain tumour; head trauma; stroke; vascular irregularity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                The present sequence encodes a murine parkin2 polypeptide. The polynucleotide sequence contains mutations, causing Gln38 to be changed to a stop codon, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multisystem atrophy, Wilson's disease, Pick's disease, Prion disease, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Alzheimer's disease; Huntington's disease; amyotrophic lateral scleros Multi-system atrophy; Wilson's disease; Pick's disease; Prion disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          to a stop codon, leading to a truncated protein. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, Multisystem atrophy, Wilson's disease, Pick's disease, Prion disease, and sevetem atrophy, Wilson's disease, Pick's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brait tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polynucleotides encoding mouse parkin2 protein, useful for producing a transgenic non-human animal as an animal model for neurodegenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes a murine parkin2 polypeptide. The polynucleotide sequence contains mutations, causing Asn54 to be changed

The sequence contains the mutation Thr415Asn. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. The are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multi-system atrophy, Wilson's disease, Pick's disease, Prion disease, and
                                                                                                                                                                                                                                                                                                                                                                               secondary causes inducing Parkinson's syndromes like toxins, drugs, tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin

                                                      The present sequence encodes a murine parkin2 polypeptide. Mutations or deletions in the parkin2 gene cause Parkin2on's disease in humans. The human parkin2 gene is located in gene region 625-2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multi-system atrophy, Wilson's disease, Pick's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active
                                                                                                                                                                                                                                                                                                                                                                                                                                      Disclosure;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Parkin2; Parkinson's disease; 6q25.2-27; neurodegenerative disease; Alzheimer's disease; Huntington's disease; amyotrophic lateral scleros; Multi-system atrophy; Wilson's disease; Pick's disease; Prion disease; brain tumour; head trauma; stroke; vascular irregularity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes a murine parkin2 polypeptide. The sequence contains the mutation Trp453Stop. Mutations or deletions in the parking gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polymucleotides are useful for analysing neurodegenerative diseases. are also useful for testing the efficacy of the treatment of a neurodegenerative disease such as Parkinson's disease, Alzheimer's disease, Huntington's disease, amyotrophic lateral sclerosis, Multisystem atrophy, Wilson's disease, Pick's disease, Prion disease, and secondary causes inducing Parkinson's system atrophy, Head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polynucleotides encoding mouse parkin2 protein, useful for producing a transgenic non-human animal as an animal model for neurodegenerative

The sequence contains the mutation Lysi6lAsm. Mutations or deletions in the parkin2 gene cause Parkinson's disease in humans. The human parkin2 gene is located in gene region 6q25.2-27. Parkin2 polypeptides and polynucleotides are useful for analysing neurodegenerative diseases. They neurodegenerative disease such as Parkinson's disease, They neurodegenerative disease, amyotrophic lateral sclerosis, Multidisease, Huntington's disease, amyotrophic lateral sclerosis, Multisystem atrophy, Wilson's disease, Pick's disease, Prion disease, and secondary causes inducing Parkinson's syndromes like toxins, drugs, brain tumours, head trauma, stroke, vascular irregularities or metabolic irregularities, associated with a less active or non-active parkin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Parkin2; Parkinson's disease; 6q25.2-27; neurodegenerative disease; Alzheimer's disease; Huntington's disease; amyotrophic lateral sclerosis; Multi-system atrophy; Wilson's disease; Pick's disease; Prich disease; brain tumour; head trauma; stroke; vascular irregularity;
